Q: Java ASM - Display contents of Field I'm using ASM library to display the contents of a field, but I get an error: Exception in thread "main" java.lang.ClassFormatError: Illegal access to constant field My code is: class A { public String name; } class B extends A { public String language; } public class Main { public static void main(String[] args) { Class aClass = Main.class.getClassLoader().loadClass("A"); Field aClassField = aClass.getDeclaredField("name"); System.out.println( "name: " + aClass.name); Class bClass = Main.class.getClassLoader().loadClass("B"); Field bClassField = bClass.getDeclaredField("language"); System.out.println( "language: " + bClass.name); // ASM aClass.getDeclaredField("name").set("abc"); System.out.println("OK"); bClass.getDeclaredField("language").set("def"); System.out.println("OK"); } } But in the first call of System.out.println, I get the error. A: Statically, fields are initialized to null, and you're trying to use the field after having set it to null. You need to do this instead: Class aClass = Main.class.getClassLoader().loadClass("A"); Field aClassField = aClass.getDeclaredField("name"); aClassField.set(null, "abc"); System.out.println( "name: " + aClass.name); Q: Android: Specific Database Error Edit: I finally got it to work. See below for details. Android: Specific Database Error I'm using a database with the following layout

### What's New in the?

Cow-to-dog transmission of atypical Johne's disease among feedlot cattle using fecal culture and PCR. The objective of this study was to evaluate the occurrence of atypical Johne's disease (AJD) among cattle by fecal culture and PCR in Northern Ireland. Fecal specimens from 2,500 slaughtered cattle were collected at meat inspection in 2 commercial slaughterhouses. Fecal culture and PCR were conducted to test for Mycobacterium avium subsp. paratuberculosis (MAP) from 15,506 samples. Positive samples were evaluated for bacterial biochemical characteristics and spoligotyping. Overall, 23 (0.95%) cattle were culture positive; 48 (1.99%) were PCR positive; 12 were confirmed by spoligotyping. The most frequent spoligotypes were Singleton 926 (10 cattle), Singleton 911 (6 cattle), and Singleton 1752 (4 cattle). Collectively, these observations indicate that cattle are a possible reservoir for infection with MAP in Northern Ireland. Q: Regex to capture groups for sorting using PHP I have a text like this: I need to sort (give URL) path of all the nodes and somehow group the nodes with the cat and dog in a path. for instance: Since cat\_1 comes after cat\_2 and cat\_3 respectively, the resulting URL is [cat\_1/dog\_1/cat\_2/dog\_2/cat\_3/dog\_3]. This should work for any number of nested/contained nodes. Note that, cat\_1, dog\_1 and the URLs like "cat\_1/dog\_1" should be ignored. I already have a solution for this but it's extremely inelegant and not efficient. Is there any way in PHP to achieve this? I'm also open to another solution such as parsing the text in other ways so I don't have to do it with a regular expression. Any advice? Thanks a lot in advance! A: Okay I have figured out this solution now: \$path = "
