Q: Modal window which closes itself after submitting a form I have a bootstrap modal window which opens upon button click: Filter All and modal content is wrapped in another one: × Title ... Now, after the modal closes I want to append some data to the URL and then re-open the modal and pass data to it. How to do it? A: You can use the `$.post` function with `.ajax` to send a post request to the current URL. You can pass the data as a JSON encoded string as the data property: `$.post('url', "`

```
function(data){ $('#modal-  
content').html(data);  
$('#modal').modal('show'); }); Update: Or  
you can use the method jQuery.getJSON  
which is basically the same as $.post only  
that it doesn't automatically wrap data in an  
array and instead returns it as JSON, which  
is much more
```

What's New In?

” says Dyson. Our lab also studies how bacteria move through the body. Most cells at any one time in an individual are resting,

but they are always in transit, either migrating to a site for repair, renewing their surface membrane as they continue their journey or dividing, to produce more cells. As we study the movement of bacteria in the body, we have developed a suitable model for human cells. We have also developed techniques that allow us to track the movements of individual bacterium within the body. These techniques are so precise that we can generate movies to show the movement of individual bacteria. “We show that bacteria behave like motile cells. They move through the lymph stream

by following the direction of the force of fluid motion. They also change their direction of motion within this flow,” says Jérémie Iglesias. Moving through the lymph stream In the large, vital organs such as the heart and the lung the lymph flow is continuous through any single part, like a system of tubes, says Katherine Wright. They send lymphocytes to the places where they need to repair tissue and where they must have contact with a variety of antigens, that is to say, proteins that can stimulate the body’s immune system. “The lymph cells are a lot like immune cells.

They are constantly on the move,” says Wright. When lymph cells are carrying out their important duties in the body they need to find their way through the surrounding network of lymphatic vessels. There they stop at junctions where they can examine the antigen they have been carrying for many days and then, if they are suitable, continue their journey along a lymph vessel so that they can direct the rest of their journey. “This could mean following the flow of the lymphatics to their destination,” says Wright. This means that it could be possible to track the progress of a

lymphocyte or bacteria from the time they leave the blood, move through the lymph in the body and reach their final destination. We can use similar techniques to study bacteria that are moving through the body's lymphatic system. By making the bacteria fluorescent, we can track their progress and so see how they interact with the cells of the body. Why bacteria can invade Disease-causing bacteria can cause a build up of pressure in the lungs and in the heart, which can lead to pneumonia or heart
