DESCRIPTION: (Applicant's Abstract) In order to prevent the occurrence of malignant tumors at high-risk sites, it is necessary to perform frequent examinations for patients with hereditary cancer syndromes. The authors developed an autonomous robot, "CARE-S," which not only detects and measures the motions and environments of patients, but also provides occupational therapy. CARE-S is a spherical robot which has a two-axis steering mechanism and is controlled by a three-axis computer-controlled motor. CARE-S is autonomous and is designed to provide occupational therapy to a patient on wheels. The authors performed a clinical trial of CARE-S to study patients with hereditary tumor syndromes in an occupational therapy program. They also explored the effects of rehabilitation on the control of symptoms and quality of life. From these results, they concluded that this system is useful for patients with hereditary cancer syndromes to prevent the recurrence of malignant tumors.Q: MySQL: Is it possible to query a view containing a function and store the result in a variable?
